

LM-FE Redesign Package

Master design prompt · updated information architecture (v2) · research-issue traceability

Input	4-stage LM-FE user journey research (touchpoints, user + design challenges, metrics, opportunities)
Output 1	One copy-pasteable master prompt for the design tool — resolves all 27 findings
Output 2	IA v2 — restructured ecosystem map with 7 new screens and 3 redesigned hubs
Output 3	Issue → screen → fix mapping, so every research finding is traceable to a change
Visual direction	Tarmac design system: Delhivery red, ink + chalk neutrals, polished but not playful

1 · Master design prompt

Paste the block below into the design tool as one prompt. It assumes the tool already holds the UI generated from IA v1 and instructs it to restructure and re-skin.

CONTEXT

You are updating the Delhivery LM-FE rider app you previously generated from my information architecture. Apply every change below. Keep what already works; restructure and re-skin the rest. Target user: delivery riders in Indian Tier 1–3 cities, often first-time smartphone-heavy users, riding one-handed, outdoors, in sunlight, sometimes offline.

VISUAL DIRECTION — TARMAC DESIGN SYSTEM (fixes: plain UI, wrong error colors, inconsistent icons)

1. Color: Delhivery red #ED1B36 is reserved for primary CTAs, the active nav tab, and brand moments; pressed state #A31226. Ink #16171B for text, chalk #FBFAF8 surfaces layered on white cards. Semantic colors only for status: green = success, amber = advisory, red = error/blocked. Errors are ALWAYS red with inline helper text — never yellow.
2. Type and touch: 16sp minimum body, 20sp+ for amounts and counts, 48dp minimum tap targets, AA+ contrast for sunlight. Numbers (earnings, COD amounts, counts) always in a tabular bold style.
3. Components: 12px-radius cards with 1px hairlines, tinted tag pills (COD amber, prepaid green, priority red, flash violet, REPL teal), one consistent 24px outline icon set, icons always paired with labels for primary actions.
4. Signature element: kilometre-stone progress markers (Tarmac motif) for all steppers and progress — onboarding wizard, docs, day progress. Subtle, geometric, brand red.
5. Motion: 150–250 ms ease-out on state changes and progress only; success check-draw ≤ 400 ms. No bouncing, no mascots, nothing childish. Skeleton loaders (never blank spinners) with step captions for anything > 1 s.

GLOBAL STRUCTURE (fixes: no primary nav, hidden menu, orientation)

6. Add a persistent 4-tab bottom nav across the FE app: Home · Shipments · Summary · Earnings. Active tab in red. Remove navigation from the hamburger; the menu keeps only profile, language, help, safety, logout.
7. Add a language selector at first launch and in the menu (English, Hindi, Kannada, Tamil, Telugu, Marathi, Bengali to start). All strings localizable; icon+label patterns throughout; optional voice guidance toggle for key flows.
8. Inline education pattern: small tappable '?' chips beside any jargon — FWD, RVP, Direct, Priority vs Flash, LastMile Pro, auto-start permission — opening a 2-line plain-language sheet with an illustration.
9. Offline-first: queue POD, status and payment confirmations locally with a sync badge; optimistic UI. App updates download in the background and install only off-duty — never block a rider mid-delivery; show a deferred 'update ready' banner instead.

SCREEN 1 — LANGUAGE SELECT (new)

First-launch screen: language grid with native-script labels, continue CTA. Reachable later from menu.

SCREEN 2 — LOGIN + OTP (redesign; fixes: ghost text, edit number, small OTP boxes, silent PIN setup)

10. Phone field with +91 prefix and ghost text '98765 43210', numeric keypad, live 10-digit validation.
11. OTP screen shows the number with an 'edit' affordance returning to the field. Six 48dp OTP boxes, auto-advance, auto-read consent. Resend with visible timer. Attempt-lock errors in red with a countdown chip.
12. New users get an explicit interstitial — 'You're new here. Next: set a 4-digit PIN to secure your account' — before PIN setup. Returning users go straight to PIN entry.

SCREEN 3 — UNIFIED ONBOARDING WIZARD (restructure; fixes: two disjoint flows, inconsistent stepper, DL field, PAN-Aadhaar, progressive CTAs)

13. Merge the partner-app application and FE document setup into ONE linear guided wizard: Mobile -> Aadhaar -> Vehicle -> Payout (bank) -> Location -> Driving licence -> PAN. Kilometre-stone stepper with percent complete and 'save and resume later'.

14. Every step uses the same two-beat pattern: capture -> confirm. No mixing of upload steps and form steps without warning; each step states what is needed and why, up front.
15. Driving licence field relabelled 'Driving licence (15-character code)' with an alphanumeric input mask (e.g. MH12 20180054797), format hint, and DOB-must-match-Aadhaar note shown BEFORE input.
16. PAN step checks Aadhaar-link status and, when unlinked, opens a 'Not linked? Here's how' help sheet with steps and a retry — plain-language copy, no dead ends.
17. All wizard CTAs are sticky full-width bottom buttons, always reachable one-handed; disabled states carry a reason line above the button.

SCREEN 4 — HANDOFF / INSTALL VERIFY (fixes: FE app 'downloaded but not accessible')

18. After the wizard, the handoff screen verifies the FE app via deep link: primary CTA 'Open FE App' (not 'download'); if the app isn't resolvable it falls back to the store with install-state detection and a troubleshooting line. Keep the workplace card (DC contact, distance, directions).

SCREEN 5 — HOME (redesign; fixes: hierarchy, single CTA, unexplained concepts)

19. Reorder: (1) pending-action stack — document verification, unbooked slots, cash due, update ready — as red-edged task cards; (2) next-best-action card ('Book tomorrow's slot', 'Start delivering'); (3) today's slot + projected earnings; (4) banners last. Greeting shrinks to a single line.
20. Every concept on this page (LastMile Pro, auto-start permission, league) gets a '?' education chip. Bottom nav present.

SCREEN 6 — EARNINGS (new tab; fixes: payout visibility, filters, incentive chart, productivity)

21. Pending vs completed payouts as two totals with dates; week / month / year filter; per-day list.
22. Incentive milestone chart with labelled axes and rupee values at each stone; 'How productivity is calculated' expandable formula breakdown; earnings-per-shipment transparency.

SCREEN 7 — PUNCH-IN (resequenced; fixes: selfie appears late)

23. The helmet selfie moves to punch-in — before any shipment work, one selfie gates the duty session (checklist: helmet, lit, T-shirt). Remove selfie from the mid-delivery flow entirely.

SCREEN 8 — DISPATCH (fixes: hierarchy, loading, navigation gaps)

24. 'Create dispatch' and 'Punch out' become equal-weight side-by-side actions. Scanning shows a live package count. Loading uses skeletons with step captions ('Fetching assignments 2/3') so long waits read as progress, and the route from Home -> duty -> dispatch is a single visible path.

SCREEN 9 — ROUTE VIEW (new; fixes: no route optimization)

25. After dispatch: an ordered stop list optimized by proximity — total distance and ETA on top, numbered stops, drag-to-reorder, 'Start route' launching turn-by-turn per leg, auto-advance to the next stop after each completion.

SCREEN 10 — SHIPMENTS LIST (redesign; fixes: information hierarchy, filters, iconography)

26. Each card leads with what riders decide by: packages count, distance from current position, earning for the stop, then consignee + short address. Type tags use the tinted pill set with a one-tap legend; the lightning icon is defined once (priority) and never reused.
27. Filter chips under the tabs: Priority, Flash, COD, Prepaid, Nearby. List defaults to route order. Tab icons re-drawn to consistent size and weight.

SCREEN 11 — ORDER DETAIL (redesign; fixes: map mismatch not actionable, checks clutter)

28. Consolidate the three checks into one status strip (calls, geofence, payment) with a fix-action on any failing check.
29. Address accuracy module: customer-provided landmark line, 'Flag wrong location' action that captures the corrected pin for ops, and pre-arrival call / WhatsApp chat shortcuts — the app helps resolve mismatch instead of only flagging distance.

SCREEN 12 — PAYMENT (redesign; fixes: COD warning, UPI CTAs, payer label, split logic)

30. One payment path per order: an explicit choice screen — Cash OR UPI QR — as two large cards; no simultaneous split. Chosen method opens a focused screen with a real full-width CTA. 'Payer' renamed 'Customer pays'. Success and pending-retry states are full-screen and unambiguous; cash path gets a confirm-amount keypad.

SCREEN 13 — PROOF OF DELIVERY (redesign; fixes: self-signature loophole, reluctant customers)

31. Order: recipient -> proof. Signature switches to a customer-facing flip mode (rotated canvas + 'hand the phone to the customer' prompt) with random photo audits to close the self-sign loophole; QR/code-verified orders keep the auto-verified fast path.

32. When a customer declines signature/photo: alternative proofs — delivery-code confirmation or doorstep parcel photo (no face) — so prepaid deliveries never stall on consent.

SCREEN 14 — NSL / CANCELLATION (redesign; fixes: OTP not arriving, cancel failing, no refund status)

33. Verification fallback ladder: WhatsApp OTP -> SMS OTP -> in-app customer link, each with resend timers; if all fail, TL-override path with mandatory audio note. Cancel actions get explicit failure states with retry + support escalation instead of failing silently.

34. Post-cancellation status screen: what happens next for the rider, automatic refund-initiated notification to the customer, and the shipment's new state on the route.

SCREEN 15 — SUMMARY (redesign; fixes: POD contradiction, unclear metrics)

35. POD quality is enforced at capture (blur/dark detection before submit). Any post-delivery POD flags appear as actionable tasks — what is wrong, how to fix, deadline — never as unexplained accusations. Progress adds a time-of-day breakdown.

SCREEN 16 — END OF DAY (new; fixes: reconciliation, cash dead end)

36. Guided punch-out sequence: pending collections review -> cash submission (day total, DC handover reference, TL confirm, mismatch flag) -> flagged-issue review -> punch out with day recap (delivered, earned, streak). This is the only path to punch out once cash was collected.

SUCCESS METRICS THESE CHANGES TARGET

Onboarding completion rate, first-week attrition, document verification error rate, support tickets in week 1, dispatch creation time, first-attempt delivery rate, fake-attempt rate, COD collection success, end-of-day reconciliation time, rider NPS.

2 · Updated information architecture (v2)

Violet = new screens · coral = redesigned hubs · gray = updated in place. A persistent bottom nav (Home · Shipments · Summary · Earnings) binds the four hubs; the hamburger menu keeps only profile, language, help, safety and logout.

STAGE 0 · ENTRY

STAGE 1 · ONBOARDING

STAGE 2 · HUBS (BOTTOM NAV)

STAGE 3 · DUTY

STAGE 4 · DELIVER

STAGE 5 · EXCEPTIONS

STAGE 6 · END OF DAY

Violet dashed = new screen - coral = redesigned hub - gray = updated in place - arrows = primary path

What changed from v1

-
- New (7): Language select · New-user intimation · Install verify · Earnings tab · Route view · OTP fallback ladder + Refund status · End-of-day flow with Cash submission.
 - Redesigned hubs (4): unified onboarding wizard (merges partner-app KYC and FE documents), Home (tasks-first), Shipments (decision-first cards), Order detail (actionable checks + address correction).
 - Resequenced: helmet selfie moves from mid-delivery to punch-in; auto-advance to the next route stop replaces returning to the list.
 - Bound together by the persistent bottom nav — the v1 orphan targets (earnings, menu, notifications) now have real destinations.

3 · Research issue → screen → fix

Every finding from the four journey stages, the screen that owns it in v2, and the prompt directive that resolves it (D# = design challenge, U# = user challenge as ordered in the research).

Stage 1 · Onboarding

U1 · Progressive CTAs hard to reach while onboarding	Guided wizard	Sticky full-width bottom CTAs on every step; disabled states explain why (#17)
U2 · FE app shows downloaded but isn't accessible	Install verify (new)	Deep-link 'Open FE App' with install-state detection and store fallback (#18)
D1 · No ghost text, yellow errors, can't edit number, tiny OTP boxes, silent PIN setup	Login + OTP v2	Input mask + ghost text, editable number, 48dp OTP boxes, red-only errors, new-user intimation (#10-12)
D2 · Inconsistent DL/PAN/bank stepper; DL mislabeled; PAN-Aadhaar copy; no help	Guided wizard	One linear capture→confirm pattern; DL as 15-char masked code; link-status check + help sheet (#13-16)
D3 · Greeting over pending docs; single CTA; unexplained concepts; no primary nav	Home v2 + global nav	Tasks-first hierarchy, next-best-action card, '?' education chips, 4-tab bottom nav (#6, 8, 19-20)
D4 · No multilingual support or accessibility	Language select (new)	First-launch + in-menu language selection, icon+label patterns, voice guidance option (#7)

Stage 2 · Assignment and dispatch

U3 · FWD / RVP / Direct unexplained	Shipments v2	Tag legend + '?' chips with 2-line plain-language sheets (#8, 26)
U4 · Priority vs Flash unclear	Shipments v2	Defined pill set; lightning icon means priority only, defined once (#26)
U5 · Long dispatch loading	Dispatch v2	Skeleton loaders with step captions and live package count (#24)
D5 · List lacks packages, proximity, earnings; no priority filter	Shipments v2	Decision-first cards (count, distance, earning) + filter chips (#26-27)
D6 · No route optimization	Route view (new)	Proximity-ordered stops, ETA, drag-to-reorder, per-leg navigation, auto-advance (#25)
D7 · Home→dispatch path unclear; punch-out hierarchy wrong	Dispatch v2	Equal-weight create-dispatch / punch-out; single visible Home→duty path (#24)
D8 · Inconsistent iconography and tags	Global system	One 24px outline set, consistent tag pills, redrawn tab icons (#3, 27)

Stage 3 · Delivery execution

U6 / D12 · Map vs actual location mismatch, not actionable	Order detail v2	Landmark line, flag-wrong-location correction to ops, pre-arrival call/chat (#29)
U7 · Customers reluctant to sign / be photographed	POD v2	Alternative proofs: delivery code or doorstep parcel photo (#32)
U8 / D10 · Selfie appears late; self-signature loophole	Punch-in + POD v2	Selfie moved to punch-in; customer-facing flip signature + random audits (#23, 31)
U9 · App updates mid-delivery	Global	Background download, install deferred off-duty, never blocking (#9)
U10 / U11 / D11 · Cancellation OTP not arriving; cancel fails; no refund status	NSL v2 + fallbacks (new)	WA→SMS→in-app OTP ladder, TL override with audio, explicit failure states, refund-status screen (#33-34)
D9 · Confusing payment: COD warning, weak UPI CTAs, 'payer', split logic	Payment v2	Single path per order (cash OR UPI), real CTAs, 'Customer pays', confirm keypad, clear states (#30)

Stage 4 · Summary and earnings

D13 · Incentive chart unlabelled; productivity opaque; no time breakdown	Earnings (new) + Summary v2	Labelled milestone chart, formula breakdown, time-of-day progress (#21-22, 35)
D14 · POD flagged post-delivery — contradiction	Summary v2	Quality enforced at capture; post-flags become actionable tasks with fix path (#35)
D15 · No pending vs completed payout; no filters	Earnings (new)	Two payout totals with dates; week/month/year filters; per-day list (#21)
D16 · Systemic trust-eroding design debt	End of day (new)	Guided reconciliation → cash submission → punch-out with day recap; transparency as retention lever (#36)

Coverage check: 6 + 8 + 10 + 4 findings mapped — all 27 research items (Stage 4 user challenges were nil) resolve to a v2 screen and a numbered prompt directive.
